Canon printers come with their own driver disks which customers need to install before setting up the printer with the system or device. Now, while installation of the driver, there may be certain system specific issues which may spawn up. These issues are mostly due to the operating system or the bit configuration of the system which is being used by the user. For example – 64 bit driver software would not get installed in a 32 bit operating system. Hence, the driver application must be in synch with the system with which the printer is going to be connected so as to get installed successfully.
