Fat freeze, commonly known as “Cryolipolysis,” is a medical treatment used to destroy fat cells. Its principle relies on controlled cooling between -5 and -9 degrees for the non-invasive localised reduction of fat deposits in order to reshape body contours. Cryolipolysis was invented at Harvard University by Manstein (MD, PhD), and Anderson (MD), when they accidentally founded that the adipose cells within the human body can be frozen which means they cannot carry energy and more importantly cannot reproduce. Therefore as a result the lymphatic system flushes these, “dead cells,” out of the body. At present, cryolipolysis has become one of the more popular methods of fat reduction as it benefits from being non surgical, non invasive and allows individuals to resume everyday activities straight after

at Freeze (Oxfo

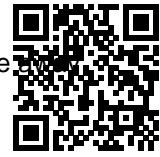

It is important that Freeze, Cryolipolysis, Weight Reduction, Weight Loss, Ultrasound

us that we understand the following:

and your goals;

reference once

treatment.						
<p>Surgery and radiotherapy benefit colorectal cancer patients, one trial shows people without losing their quality of life.</p>						

Cryolipolysis / Fat Freeze (Oxford) - It is important to us that we understand your goals; therefore once

we have undergone a full consultation we can begin the treatment immediately.

Cryolipolysis sessions last approximately 1 hour, during which time a cool gel pad will be placed onto the patient's target areas. Patients will experience a mild cooling sensation through a vacuum, which draws in the fat; this is perfectly normal and all apart of the fat freezing procedure.

Throughout the session the temperature will gradually fall to -7 to -8 degrees Celsius thus freezing the fat cells. Once the treatment is over, a physician will remove the gel pad and massage the now contorted layer of fat back into shape. Patients can expect zero discomfort during the session but may however, depending on each individual's skin tolerance, experience temporary bruising once the Cryolipolysis procedure is over.

Cryolipolysis Sessions (Oxford): Studies have shown Cryolipolysis generally results in a 20% reduction in the number of fat cells from the very first session. Therefore, the number of sessions required are contingent upon your aims.

Cryolipolysis After care (Oxford): Although the number of fat cells has been reduced during Cryolipolysis, patients are still advised to live a healthy lifestyle as this will help maintain their perfect body. It is also important to exercise regularly as this will assist in the metabolism of the dead fat cells.

Treatment Prices (Oxford):

Fat Freezing / Cryolipolysis (Oxford) - Clinically proven, Cryolipolysis causes fat loss by freezing fat cells in targeted areas. From £99

Radio frequency face lift (Oxford) - Cavitation uses ultrasonic frequencies to penetrate fat cells. From £49

Ultrasound inch loss (Oxford) - Our non-surgical radio frequency facelifts can reduce the signs of ageing in as little as one session. From £99

What procedures do you offer?

VIVO Clinic Oxford offers non-invasive cosmetic procedures including Cryolipolysis Fat Freezing, Ultrasound Cavitation (inch loss) and Radio Frequency Facelifts.

Do the procedures work?

All of our procedures are clinically proven and we encourage our clients to research our techniques themselves, so they have peace of mind before we perform the procedure.

How much does it cost?

Treatments at VIVO Clinic Oxford start from just £99 which is considerably less than surgery and we also offer 0% finance.

Where can I find out more about the procedures?

There is an abundance of third party information on clinical trials relating to our procedures. There is also a large amount of information on our main VIVO Clinic website and our friendly staff members are always happy to provide a free phone consultation to talk you through the process and answer any questions that you might have.
