

**PRODUCT BENEFITS** WARMTH Wadded filling 120 g/sq.m, brushed knit lining. WATERPROOF Waterproof: coating 5,000 mm, seams not sealed. Hood. BREATHABILITY Breathable component for perspiration wicking.

**DURABILITY** Durable component, overstitched seams.

**TECHNICAL INFORMATION**

**WADDING** Thermal insulation keeps the skier or snowboarder at the right temperature: not too warm, nor too cold. The garment then adapts to the physical behaviour of the body and the outside environment. We use wadding for insulation to keep you warm. The wadding is a synthetic material with a polyester base that stores a greater or lesser quantity of air depending on the size of fibres used. The thicker the wadding, the more air there is, and the warmer it is.

**COATING TREATMENT** The coating is a watertight "material" that is applied to the inside of the outer fabric. It prevents water from seeping into the garment but allows the water vapour produced by an active body to escape. So you will stay dry and comfortable.

**WATERTIGHT MAIN SEAMS** As well as the watertight material, sealed seams are incorporated to strengthen the watertighting of the Slide 300 suit. These are watertight adhesive strips fixed to the inside seams of the garment to make it perfectly watertight.

These sealed seams are present on the areas most exposed to snow. These are usually located on the shoulders and chest pockets. The innovative Pull-N-Save allows you to pull the ski suit inside your long trousers and prevent it from ever leaving your feet. With Pull-N-Save your ski suit is never too far from you. PASS-PO-RE: you now have the power to get your clothes out from the your sleeves as you move on ice to allow you to dress the rapidly changing weather. The brand new "Polar" colour of a tiny hole from the storage. 54.99
