WordPress security is often referred to as “hardening.”. After all, the process is like adding reinforcements to your castle. It’s all about securing the gates and putting guards on every tower for better monitoring and protection against external threats. Tips for better WordPress security: Keep your WordPress site and plugins up-to-date. Consider Automatic Core Updates. This is very simple and there are plugins like WP Updates and others to help you. You may want to create a child theme before making any changes to your functions.php file. If somebody is offering Premium (Paid) plugins for free, don’t buy/download them. Quite often they would be modified and infected with malware. Click here for more tips of Wordpress security : <http://interloperinc.com/how-to-secure-your-wordpress/>.
