Pressure washing also known as power washing is a cleaning process used primarily on houses and other buildings although it can be used on other surfaces such as concrete .This washing process involves spraying the desired surface with a mechanical sprayer that shoots out water much faster and more powerfully than a regular hose. As, the water sprayed out of pressure washer comes out so fast and powerfully so it is extremely efficient in cleaning the exterior of a home.

It preserves the existing value of our home and can even increase it by removing all dirt, dust, grease, and harmful contaminants which can cause our home to disrepair. Soft water pressure washing clears away all the mold and muddy grime from the rooftop and does away with any accumulated reserves of water that could absorb into the root and cause rot. Also by eliminating the dust and grime from the outside walls power washing makes the paint on our house looks brighter and prevents it from chipping further. A more delicate soft water pressure washing can also work great.
