Manufacturability assessment offers the opportunity to evaluate the technical viability of a drug candidate at the industrial scale and functions as a bridge between discovery and process development stage. Creative Biolabs is able to evaluate key manufacturability parameters, including productivity and process yield, chemical stability, PTMs, physical stability, aggregation, electrostatic properties, and formulability (including viscosity, solubility at high concentration, and accelerated stability) through our CreDA™ platform, and the comprehensive assessment results can effectively guide the customer to select the most appropriate candidate for process development. <http://www.creative-biolabs.com/Manufacturability-Assessment>
