Image Masking ServiceGet Excellent Results with Our Expert Image Masking Service

There are times when Photoshop's clipping paths will leave behind images with very sharp edges and a lot of missing detail (mostly with hair and clothing) rendering them unsuitable for studio portrait images. This is where image masking becomes necessary.

Masks are powerful features of Photoshop with which users can select objects and areas in an image for editing and manipulation, composition or elimination and placement into other images. By using them, users can identify with precision elements of an image that is seemingly impossible to select. These include erratically focused outlines, clothing strands, hair, and chain link fences. Layer masks provide a quick way of creating a delicate combination between two images, like for instance a mixture between a model and a background that is plain white. Masking preserves a lot of details than clipping paths do and create edges that are much smoother. They are therefore more suitable for portraits, model photography or other images that involve people.
